a only C1 leaves the plateau unchanged
s_∞ = 0.800 WT and C1 (identical)
0.889 B
0.932 C2
effective survival per repeat, s
primer concentration [P] (K_d^{WT} units)
WT
B (k_{ext} up)
C1 (k_{off} down)
C2 (k_{loss} down)
b equal s means identical data
$P(\geq n) = s^{n-1}$
model B (k_{ext} doubled)
model C1 (k_{off} halved)
the two curves superimpose exactly:
$\max_n |\Delta P(\geq n)| = 0$
product length n
